Division of Experimental Animal Research in Riken contributed to prepare mouse tissues. First strand cDNA was primed with a primer [5' GAGAGAGAGAGCATCCAAGAGCTCTTTTTTTTTTTTTVN 3'], cDNA was prepared by using trehalose thermo-activated reverse transcriptase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Shibata,K., Itoh,M., Aizawa,K., Nagaoka,S., Sasaki,N., Carninci,P., Ronno,H., Akiyama,J., Nishi,K., Kitaunai,T., Tashiro,H., Itoh,M., Sumi,N., Ishii,Y., Nakamura,S., Hazama,M., Nishino,T., Harada,A., Yamamoto,R., Matsumoto,H., Sakaguchi,S., Ikegami,T., Kashiwagi,K., Yamamoto,R., Trouch,K., Togawa,Y., Izawa,M., Ohara,E., Warahiki,M., Yoneda,Y., Ishikawa,T., Ozawa,K., Tanaka,T., Matsuura,S., Kawai,J., Okazaki,Y., Muramatsu,M., Inoue,Y., Kira,A. and Hayashizaki,Y. RIKBN integrated sequence analysis (RISA) system--384-format sequencing pipeline with 384 multicapillary sequencer

This cDNA clone, designated cDNA24, is derived from human gene whose mutated form is associated with hereditary haemochromatosis (HH). It was obtained from a directionally cloned plasmid-based cDNA library following identification of the HH locus in the HLA region of chromosome 6. A single mutation (24d1) in the HH gene a ppears responsible for the majority of HH disease. This comprises a G to A substitution that is present in 86% of affected chromosomes and in 4% of unaffected chromosomes. It results in a critical disulphide bridge important for secondary structure. The cillowing are claimed: a 10825 bp genomic DNA sequence (I) (see AAT96690), the HH 437 bp cDNA sequence (Ia) and their 24d1, 24d2 and contraines; a cloning or expression vector; host cells; a peptide product chosen from the HH gene product, its variants (24d1, 24d2 and 24d7), or a peptide of at least 56 amino acid residues of these; an antibody produced using the peptide; a method contest, and all inferentiation factors and therapeutic agents for mitigation of injury due to oxidative process in vivo or mitigation of injury due to oxidative process in vivo or mitigation of injury due to oxidative process in vivo or mitigation of injury due to oxidative process in vivo or mitigation of injury due to oxidative process in vivo or the mitigation of injury due to oxidative process in vivo or mitigation of injury due to oxidative process in vivo or mitigation of injury due to oxidative process in vivo or mitigation of injury due to oxidative process in vivo or the mitigation of injury due to oxidative process in vivo or the mitigates oligonucleotide directed against a transcriptional product of a nucleic acid sequence as above; and oligonucleotides covering a range of nucleotides from the HH pene. The invention also relates to methods for screening of the HH homozyotes, to HH disease, including gene therapy, the protein and antibody-based therapeutics, and entided gene therapy, and small molecule
                                                                                                                                                                                                                                                                                                                                                                                                             ditary haemochromatosis gene and variants - useful for diagnosis treatment of hereditary haemochromatosis disease
                                                                                                                                                                                                                                                                               Thomas WJ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to hereditary hemochromatosis gene products. These proteins may be used to treat a patient diagnosed as having human hemochromatosis disease. It is also useful as a metal chelation agent or as a T-call differentiation factor, and for alleviating iron overload. They may also be used in protein replacement

This sequence represents the haemochromatosis (HC) gene. Mutations in this sequence are detected using the method of the invention. The method is for identifying an individual with heredizary haemochromatosis (HH) or parelisposition to develop HH or to genetically pass on HH to an offspring, comprising isolating a biological sample and amplifying a region of genomic DNA in the biological sample encompassing all or part of the DNA between markers D6S265 and D6S276, and detecting at least one homozygous or heterozygous mutation in a nucleotide within the region. The method can also be used for identifying an individual with an genetically pass on an ARD to an offspring, comprises isolating a biological sample from the individual and screening genomic DNA in the sample for the presence of a homozygous or heterozygous mutation in a gene, the normal function of which, is required to prevent progression of the disorder. The method(s) can be used to identify individuals that are homozygous or heterozygous (carriers) for the mutation causing the ARD. Especially the method is used to diagnose HH or predisposition to HH by detecting a Cys/82Tyr substitution. Individuals homozygous for this

These proteins may be used to treat a patient diagnosed as having human hemochromatosis disease. It is also useful as a metal chelation agent or as a T-cell differentiation factor, and for alleviating iron overload. They may also be used in protein replacement
